EXPERIENCE

Layerpath, Founding AI Engineer, - Architected and Shipped "Path AI", a voice-first agentic AI system with 7-stage FSM (BANT + Four Forces), processing 1,500+ calls/month at 85%+ accuracy and 75% lower cost than human SDRs; built on LiveKit + Pipecat for low-latency, production-grade voice conversations. - Designed and shipped Magic Editor, an agentic AI editing assistant for interactive product demos, solo and end to end: a multi tier LLM engine (Gemini + OpenAI) that emits JSON Schema/Zod validated action proposals, vision grounded copy rewrites, and AI voiceover, wired through a propose→confirm→apply pipeline with Brandmemory aware generation, intent routing, and edit attribution. - Architected and built BrandMemory end to end, solo (Next.js, TypeScript, Prisma/PostgreSQL), an AI brand intelligence pipeline integrating Brandfetch and Firecrawl with Gemini models to extract brand voice, tone, guidelines, and rules; implemented async job orchestration with a polling state machine, confidence-scored signal aggregation, prompt-context assembly, quota gating, and staleness-driven cache invalidation, all consumed by Magic Editor to ground its AI generation.	Remote, San Francisco. <i>Nov 2025-Now</i>
BusinessRoom, Software Engineer 1, - Improved website performance by reducing page load times by 80% (from 7s to 1.5s) through backend query optimization, caching strategies, and frontend code splitting, directly increasing user engagement and retention. - Architected and deployed scalable microservices using Docker, AWS ECS, and CI/CD pipelines, reducing release cycles by 30% while improving reliability. - Implemented AWS monitoring (CloudWatch) and logging (S3/ELK) for performance tracking and analytics, enabling data-driven improvements that increased feature adoption by 15%. Built an AI assistant for founders and investors leveraging AWS Lambda + API Gateway to provide tailored recommendations, enhancing decision making efficiency and adoption rates.	On-site, Bangalore. <i>July 2025-Oct 2025</i>
PuntPartners, Software Developer Engineer Intern, - Reverse Engineered the API's of Q-Commerce platforms to create a Crawler system for scraping API's from Q-Commerce platforms for both desktop and Mobile platforms which brought in 1000+ new users to the platforms. - Developed features for TolMol App that allows users to search for products and compare prices across different platforms. - Proactively participating in team meetings and discussions, actively sought feedback.	Remote, Bangalore. <i>April 2025-June 2025</i>
OneRoot, Full Stack Developer Intern, - Developed and implemented front-end and back-end solutions for various projects within OneRoot's Agri-Tech team, including developing POCs for new features, demonstrating proficiency in full-stack development. - Contributed to the development of user-friendly dashboards and successfully integrated third-party tools into existing products, enhancing user experience and system functionality. - Proactively participated in team meetings and discussions, actively sought feedback, and demonstrated a strong work ethic and a willingness to learn and adapt to new challenges.	On-site, Bangalore. <i>Aug 2024-Nov 2024</i>

PROJECTS

[Yuki - brew install --cask mafex11/tap/yuki](#)

- Persistent personal memory with semantic recall + nightly self-compaction: built a markdown "memory vault" with pluggable embeddings and cosine-similarity retrieval, plus an "episodist" that distills the last 7 days of activity into durable facts via an LLM, so the agent actually learns who you are instead of starting cold each session.
- Small model survival kit, toolRAG + loop guard: instead of dumping all 16 tools into every prompt, embeds each tool description once and returns the top-K by cosine similarity per task (with a fail-open fallback), and a LoopGuard that fingerprints repeated actions/desktop states to hard-stop runaway loops — concrete techniques to make cheap, fast models reliable at desktop control.
- Native Swift Python bridge over a Unix domain socket: a from-scratch HTTP/1.1 client over NWConnection (buffered + SSE streaming) connecting a SwiftUI menu-bar app to a local Python agent, with Keychain stored tokens, a global ⌘⇧A hotkey, and a "safety burst" confirmation channel — shipped as a one-command Homebrew cask. (Windows build drives native apps via UI-Automation accessibility trees + optional vision, with cooperative pause/resume and a 100+-test suite.)

[Burnt - brew install --cask mafex11/tap/burnt](#)

- Clean engine/UI split, fully unit-tested: all the logic lives in a pure UsageEngine Swift library (parse → classify → price → aggregate) with zero UI dependencies, so the cost math is testable in isolation and the SwiftUI MenuBarExtra is a thin shell on top — the kind of boundary most "menu bar app" side-projects never bother to draw.
- Zero-dependency, self-contained distribution: vendors a portable Node runtime + a pinned copy of ccusage inside the .app bundle, so brew install works with no system Node, no deps, and offline — and the release script auto-stamps the Homebrew cask's SHA-256, strips quarantine, and launches straight into the menu bar.
- Accurate-to-the-cent aggregation with derived insight: zero-filled rolling windows (7-day spend, 14-day sparkline, 84-day heatmap) computed from raw daily rows, prefix-based model→tool classification (Claude vs Codex/GPT), and a prompt-cache-savings estimator that prices (input – cacheRead) deltas — matching ccusage exactly while adding trend/pace and "you saved ≈\$Y" intelligence on top.

[Git-Schedule - mafex11/tap/git-schedule](#)

- Designed a dual execution model: the same scheduled commit runs via a lightweight local Rust daemon or a generated GitHub Actions cron (* / 5) that fires even when your machine is off and auto-disables when the queue drains.
- Crash-safe commit capture — stages work as a patch and unstages it so you keep working, then stashes/applies/commits/restores at run time with a retry queue, never corrupting the working tree.
- Structured as a 3-crate Rust workspace (cli / daemon / shared) over a typed socket protocol, with a flexible time parser (--in 1d12h30m, --at "friday 3pm"), scheduled PRs, and one-line macOS/Linux/Windows installers.

EDUCATION

Visvesvaraya Technological university
Pursuing Bachelor’s Degree in Computer Science Engineering; 8.0 CGPA, 7th Sem.

Bangalore, India
Nov 2022-Present

SKILLS

- **Languages:** C, C++, Python, Java, JavaScript, TypeScript, SQL, react native
- **Frameworks/Libraries:** React.js, Next.js, Node.js, Django, TensorFlow, TailWind CSS
- **Databases:** PostgreSQL, MySQL, MongoDB, GraphQL

PUBLICATIONS

Automated Brain Segmentation and Classification of Tumor through Robotics and Machine Learning.

- Accomplished the 1st position for the best research paper in IJIRAE (International Journal of Innovative Research in Advanced Engineering)-2023.

CERTIFICATIONS

- **EdX Verified** Certificate for Building Modern Nodejs Applications on **AWS**.
- **EdX Verified** Certificate for Building Modern Python Applications on **AWS**.
- **EdX Verified** Certificate for Introduction to Web Development with HTML5, CSS3, and JavaScript, **IBM**.
- **EdX Verified** Certificate for Python Basics for Data Science, **IBM**.

LANGUAGES

- **English** (Bilingual Proficiency)
- **Hindi** (Native or Bilingual Proficiency)
- **Japanese** (Limited Working Proficiency)
